

fMRI Dynamic Phantom for Resting-State Brain Networks

BRAINDANCER™

The ability to minimize and correct for scanner-induced distortion is a fundamental unmet need in modern task-free ("resting-state") fMRI. For task-based fMRI, subtracting noise from signal is straightforward, since a task activates the brain reliably more under one condition (signal) than another (noise). However, for task-free analyses, the 'baseline' fluctuations themselves also include the 'signal'.

The BrainDancer™ is a commercial-grade dynamic phantom, designed to identify and correct systematic scanner-induced noise using our deep learning algorithm, NoiseNet™. The BrainDancer™ dynamic phantom not only improves the signal-to-noise ratio, but can also be used for standardization of protocols and normalization between scanners.

- Pneumatically controlled movement
- Rotating inner cylinder to produce T2* changes within voxels
- Imitates BOLD amplitudes of human brains
- Motion is synchronized with MR scanner
- Externally triggered programmable sequences
- NoiseNet™ software for temporal noise estimation included

● **Available from ALA Q4 2019** ●
International patent pending

Abstract ID# 4750

***Your signal is dynamic.
Why isn't your phantom?***

BRAINDANCER™

-  *Cleaner signal*
-  *Stronger results*
-  *Better integration of fMRI data across scanners and sites*

**BRAINDANCER™
as seen at OHBM booth 34**
